Plain Concepts' commitment to building custom, technically ambitious solutions — not just outsourcing — stands out in a space where many settle for off-the-shelf approaches.

Over the past five years, I've led and contributed to end-to-end Flutter development across AI-driven and scalable mobile applications. At Finva Tech, I currently lead a team of Flutter developers on an AI-integrated mobile platform, guiding architecture decisions, ensuring timely delivery, and embedding features that elevate user experience. Prior to that, at Act T Connect, I played a key role in optimizing performance and mentoring junior developers while driving the adoption of new Flutter capabilities to improve scalability and maintainability.

My foundation in mobile development began in 2018, and since then I've built a strong track record with Flutter, Dart, Firebase, and REST APIs. I've worked across the full development lifecycle — from architecture and UI/UX design to integration and release — and have consistently contributed to clean, maintainable codebases using state management best practices. I'm also experienced in collaborating across teams and mentoring peers, aligning well with your emphasis on technical excellence and knowledge-sharing.

While I haven't yet worked directly in a client-facing consultancy model, I've led cross-functional teams and translated complex requirements into technical solutions, which has prepared me to engage with stakeholders and own delivery outcomes. I'm confident in my ability to quickly adapt to your agile, multidisciplinary environment and contribute from day one.

I'd welcome the opportunity to bring my experience to Plain Concepts and help shape impactful mobile solutions alongside your team.
